---

TEACHING ASSISTANT: DAVID TRABISH

# LR(0) Parsing

- Build the derivation tree from the bottom
- First build the children, then connect to the parent
- Can handle left recursion
  - Which is common in real-world grammars

# LR(0) Item

An LR(0) item is of the form:

- $N \rightarrow \alpha.\beta$

The **dot** gives us the current location (a local view).

# LR(0) Item

An LR(0) item with the dot at the end is called **reduce** item:

- $N \rightarrow \alpha\beta.$

Otherwise, it's a **shift** item:

- $N \rightarrow .\alpha\beta$
- $N \rightarrow \alpha.\beta$

# LR(0) Item Closure Set

The **LR(0) closure set** of an LR(0) item  $i$  is a set  $S$  such that:

- $i \in S$
- If  $A \rightarrow \alpha.N\beta \in S$  then for each rule  $N \rightarrow \gamma$ :
  - $N \rightarrow.\gamma \in S$

# LR(0) Item Closure Set

For example, given the following CFG:

- $S \rightarrow E\$$
- $E \rightarrow ID = X$
- $E \rightarrow \{ID\}$
- $X \rightarrow INT$

the closure set of the  $S \rightarrow .E\$$  contains:

- $S \rightarrow .E\$$
- $E \rightarrow .ID = X$
- $E \rightarrow .\{ID\}$

# LR(0) Parsing

Consider the following CFG:

- $S \rightarrow E\$$
- $E \rightarrow ID = INT$
- $E \rightarrow \{L\}$
- $L \rightarrow E$
- $L \rightarrow L; E$

What will be the **transition system** of the LR(0) parser for this CFG?

# LR(0) Parser

We start with the initial LR(0) item (that comes from the initial rule):

- $S \rightarrow .E\$$

The initial state is the  $\epsilon$ -closure of that item, which contains:

$$\begin{aligned} S &\rightarrow E\$ \\ E &\rightarrow ID = INT \\ E &\rightarrow \{L\} \\ L &\rightarrow E \\ L &\rightarrow L; E \end{aligned}$$

# LR(0) Parser

We start with the initial LR(0) item (that comes from the initial rule):

- $S \rightarrow .E\$$

The initial state is the  $\epsilon$ -closure of that item, which contains:

- $S \rightarrow .E\$$
- $E \rightarrow .ID = INT$
- $E \rightarrow .\{L\}$

$S \rightarrow E\$$   
 $E \rightarrow ID = INT$   
 $E \rightarrow \{L\}$   
 $L \rightarrow E$   
 $L \rightarrow L; E$

**$s_0$ :**

**$S \rightarrow .E\$$**

**$E \rightarrow .ID = INT$**

**$E \rightarrow .\{L\}$**

# LR(0) Parser

From  $s_0$ , if we recognized  $ID$ , then the next state will contain:

- $E \rightarrow ID. = INT$

So the next state (the  $\epsilon$ -closure) contains:

$S \rightarrow E\$$   
 $E \rightarrow ID = INT$   
 $E \rightarrow \{L\}$   
 $L \rightarrow E$   
 $L \rightarrow L; E$

# LR(0) Parser

From  $s_0$ , if we recognized  $ID$ , then the next state will contain:

- $E \rightarrow ID. = INT$

So the next state (the  $\epsilon$ -closure) contains:

- $E \rightarrow ID. = INT$

$S \rightarrow E\$$   
 $E \rightarrow ID = INT$   
 $E \rightarrow \{L\}$   
 $L \rightarrow E$   
 $L \rightarrow L; E$

**$s_0$ :**

$S \rightarrow .E\$$

$E \rightarrow .ID = INT$

$E \rightarrow .\{L\}$

ID

**$s_1$ :**  $E \rightarrow ID. = INT$

# LR(0) Parser

From  $s_1$ , if we recognized  $=$ , then the next state will contain:

- $E \rightarrow ID =.INT$

So the next state (the  $\epsilon$ -closure) contains:

$S \rightarrow E\$$   
 $E \rightarrow ID = INT$   
 $E \rightarrow \{L\}$   
 $L \rightarrow E$   
 $L \rightarrow L; E$

# LR(0) Parser

From  $s_1$ , if we recognized  $=$ , then the next state will contain:

- $E \rightarrow ID =.INT$

So the next state (the  $\epsilon$ -closure) contains:

- $E \rightarrow ID =.INT$

$S \rightarrow E\$$   
 $E \rightarrow ID = INT$   
 $E \rightarrow \{L\}$   
 $L \rightarrow E$   
 $L \rightarrow L; E$

**$s_0$ :**

$S \rightarrow .E\$$

$E \rightarrow .ID = INT$

$E \rightarrow .\{L\}$

ID

**$s_1$ :**  $E \rightarrow ID. = INT$

=

**$s_2$ :**  $E \rightarrow ID =.INT$

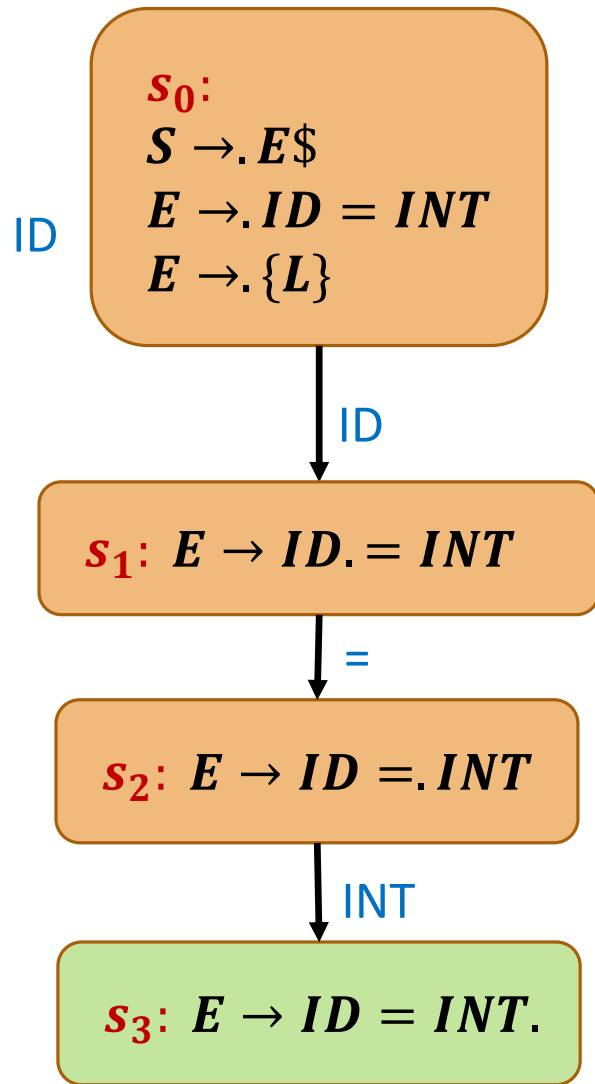

# LR(0) Parser

From  $s_2$ , if we recognized  $INT$ , then the next state will contain:

- $E \rightarrow ID = INT$ .

Which is a reduce state.

$S \rightarrow E\$$   
 $E \rightarrow ID = INT$   
 $E \rightarrow \{L\}$   
 $L \rightarrow E$   
 $L \rightarrow L; E$

# LR(0) Parser

From  $s_0$ , if we recognized  $\{$ , then the next state will contain:

- $E \rightarrow \{.L\}$

So the next state (the  $\epsilon$ -closure) contains:

$S \rightarrow E\$$   
 $E \rightarrow ID = INT$   
 $E \rightarrow \{L\}$   
 $L \rightarrow E$   
 $L \rightarrow L; E$

# LR(0) Parser

From  $s_0$ , if we recognized  $\{$ , then the next state will contain:

- $E \rightarrow \{.L\}$

So the next state (the  $\epsilon$ -closure) contains:

- $E \rightarrow \{.L\}$
- $L \rightarrow .L; E$
- $L \rightarrow .E$
- $E \rightarrow .ID = INT$
- $E \rightarrow .\{L\}$

$S \rightarrow E\$$   
 $E \rightarrow ID = INT$   
 $E \rightarrow \{L\}$   
 $L \rightarrow E$   
 $L \rightarrow L; E$

# LR(0) Parser

From  $s_4$ , if we recognized  $\{$ , then the next state will contain:

- $E \rightarrow \{.L\}$

So the next state (the  $\epsilon$ -closure) contains:

$S \rightarrow E\$$   
 $E \rightarrow ID = INT$   
 $E \rightarrow \{L\}$   
 $L \rightarrow E$   
 $L \rightarrow L; E$

# LR(0) Parser

From  $s_4$ , if we recognized  $\{$ , then the next state will contain:

- $E \rightarrow \{.L\}$
- $L \rightarrow .L; E$
- $L \rightarrow .E$
- $E \rightarrow .ID = INT$
- $E \rightarrow .\{L\}$

which was already computed:  $s_4$

$S \rightarrow E\$$   
 $E \rightarrow ID = INT$   
 $E \rightarrow \{L\}$   
 $L \rightarrow E$   
 $L \rightarrow L; E$

# LR(0) Parser

From  $s_4$ , if we recognized  $ID$ , then the next state will contain:

 $E \rightarrow ID = INT$   
 $E \rightarrow \{L\}$   
 $L \rightarrow E$   
 $L \rightarrow L; E$

# LR(0) Parser

From  $s_4$ , if we recognized  $ID$ , then the next state will contain:

 $E \rightarrow \{L\}$   
 $L \rightarrow E$   
 $L \rightarrow L; E$

# LR(0) Parser

From  $s_4$ , if we recognized  $L$ , then the next state will contain:

 $E \rightarrow ID = INT$   
 $E \rightarrow \{L\}$   
 $L \rightarrow E$   
 $L \rightarrow L; E$

    public int value;  
    public AST_EXP_INT(int value) {
