Bottom Up Parsing

TEACHING ASSISTANT: DAVID TRABISH

LR(0) Parsing

- Build the derivation tree from the bottom
- First build the children, then connect to the parent
- Can handle left recursion
  - Which is common in real-world grammars

LR(0) Item

An **LR(0) item** is of the form:

- $N \rightarrow \alpha.\beta$

The **dot** gives us the current location (a local view).

LR(0) Item

An LR(0) item with the dot at the end is called **reduce** item:

- $N \rightarrow \alpha\beta.$

Otherwise, it's a **shift** item:

- $N \rightarrow .\alpha\beta$
- $N \rightarrow \alpha.\beta$

LR(0) Item Closure Set

The **LR(0) closure set** of an LR(0) item i is a set S such that:

- $i \in S$
- If $A \to \alpha . N\beta \in S$ then for each rule $N \to \gamma$:
  - $N \to . \gamma \in S$

LR(0) Item Closure Set

For example, given the following CFG:

- $S \rightarrow E\$$
- $E \rightarrow ID = X$
- $E \rightarrow \{ID\}$
- $X \rightarrow INT$

the closure set of the $S \rightarrow .E\$$ contains:

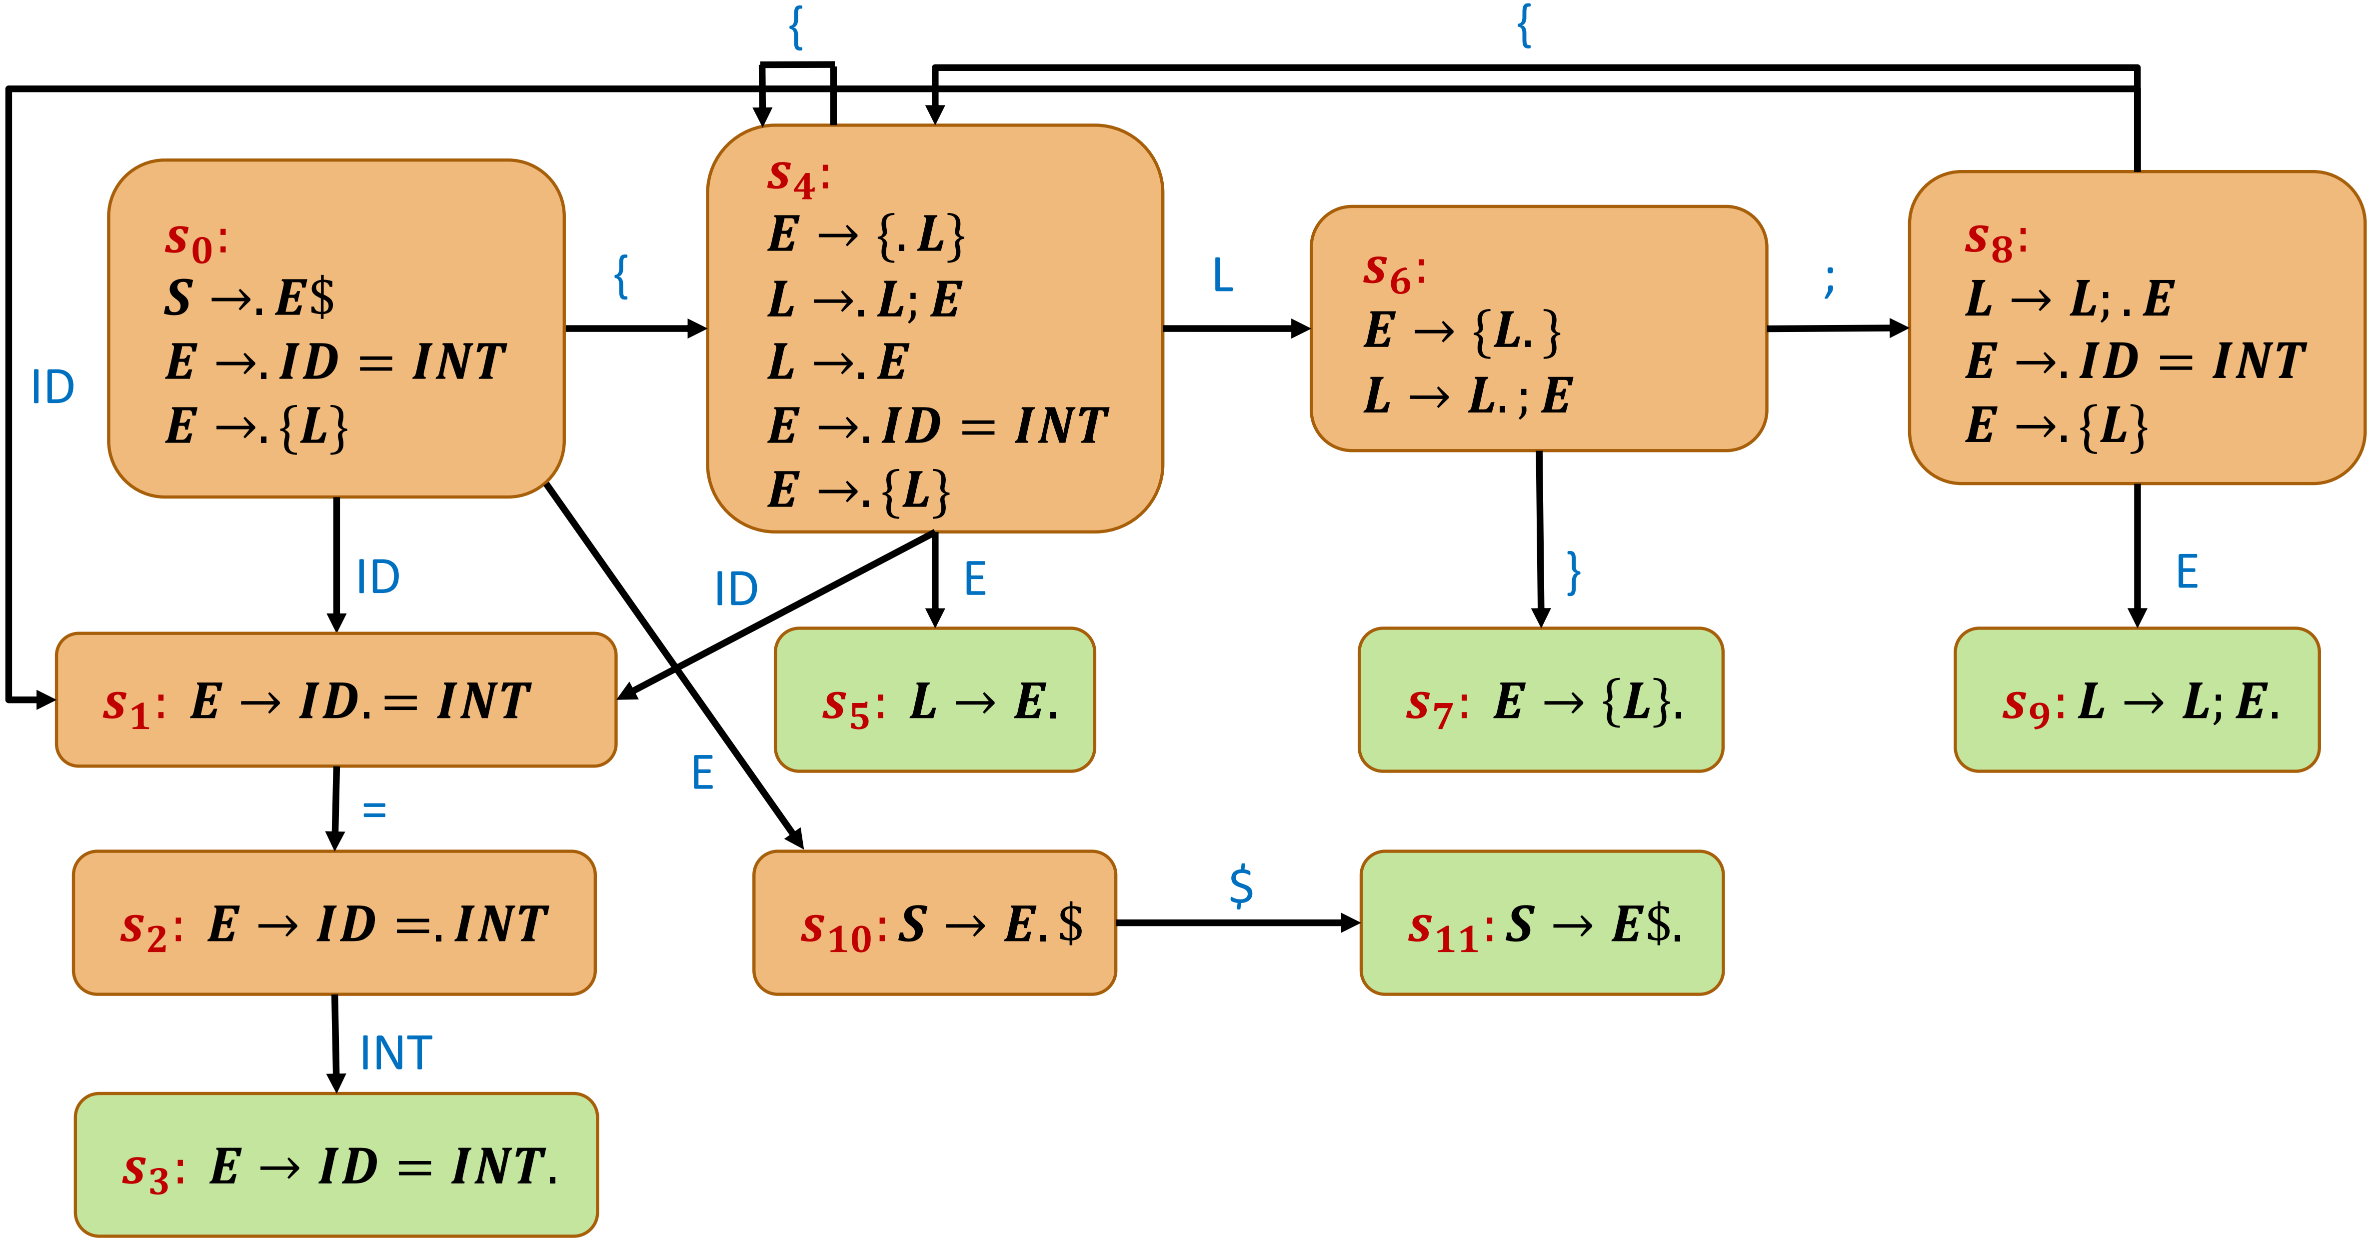
- $S \rightarrow .E\$$
- $E \rightarrow .ID = X$
- $E \rightarrow .\{ID\}$

LR(0) Parsing

Consider the following CFG:

- $S \rightarrow E\$$
- $E \rightarrow ID = INT$
- $E \rightarrow \{L\}$
- $L \rightarrow E$
- $L \rightarrow L; E$

What will be the **transition system** of the LR(0) parser for this CFG?



s_0: $S \rightarrow .E\$$
$E \rightarrow .ID = INT$
$E \rightarrow .\{L\}$
s_4: $E \rightarrow \{.L\}$
$L \rightarrow .L;E$
$L \rightarrow .E$

$E \rightarrow .ID = INT$

LR(0) Parser

We start with the initial LR(0) item (that comes from the initial rule):

- $S \rightarrow .E\$$

The initial state is the ϵ-**closure** of that item, which contains:

$$
\begin{aligned}
&S \rightarrow E\$ \\
&E \rightarrow ID = INT \\
&E \rightarrow \{L\} \\
&L \rightarrow E \\
&L \rightarrow L; E
\end{aligned}
$$

LR(0) Parser

We start with the initial LR(0) item (that comes from the initial rule):

- $S \rightarrow . E\$$

The initial state is the ϵ-closure of that item, which contains:

- $S \rightarrow . E\$$
- $E \rightarrow . ID = INT$
- $E \rightarrow . \{L\}$

$S \rightarrow E\$$
$E \rightarrow ID = INT$
$E \rightarrow \{L\}$
$L \rightarrow E$
$L \rightarrow L; E$

s_0:

$S \to .E\$$

$E \to .ID = INT$

$E \to .\{L\}$

LR(0) Parser

From s_0, if we recognized ID, then the next state will contain:

- $E \rightarrow ID. = INT$

So the next state (the ϵ-closure) contains:

$S \rightarrow E\$$
$E \rightarrow ID = INT$
$E \rightarrow \{L\}$
$L \rightarrow E$
$L \rightarrow L; E$

LR(0) Parser

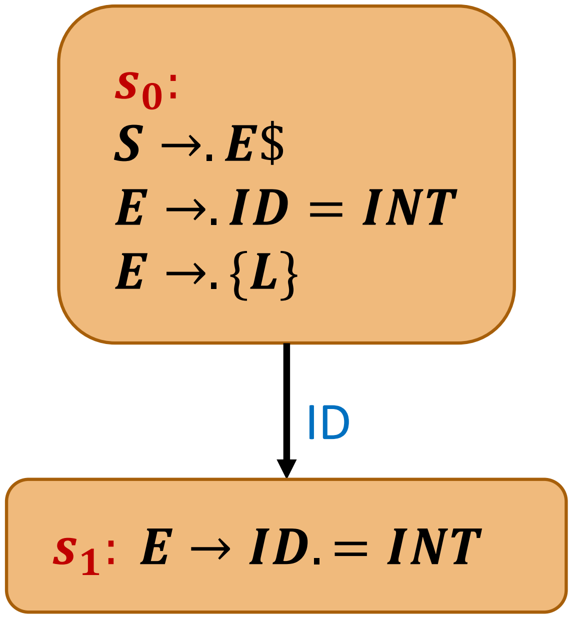
From s_0, if we recognized ID, then the next state will contain:

- $E \rightarrow ID. = INT$

So the next state (the ϵ-closure) contains:

- $E \rightarrow ID. = INT$

$S \rightarrow E\$$
$E \rightarrow ID = INT$
$E \rightarrow \{L\}$
$L \rightarrow E$
$L \rightarrow L; E$



s_0:
$S \rightarrow . E\$$
$E \rightarrow . ID = INT$
$E \rightarrow . \{L\}$
ID
s_1: $E \rightarrow ID . = INT$

LR(0) Parser

From s_1, if we recognized $=$, then the next state will contain:

- $E \rightarrow ID =. INT$

So the next state (the ϵ-closure) contains:

$S \rightarrow E\$$
$E \rightarrow ID = INT$
$E \rightarrow \{L\}$
$L \rightarrow E$
$L \rightarrow L; E$

LR(0) Parser

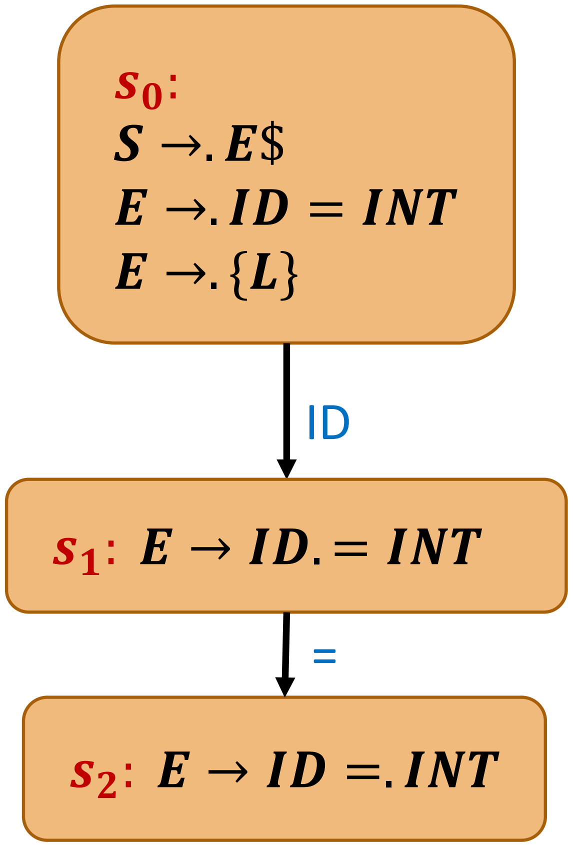
From s_1, if we recognized $=$, then the next state will contain:

- $E \rightarrow ID =. INT$

So the next state (the ϵ-closure) contains:

- $E \rightarrow ID =. INT$

$S \rightarrow E\$$
$E \rightarrow ID = INT$
$E \rightarrow \{L\}$
$L \rightarrow E$
$L \rightarrow L; E$



s_0:

$E \rightarrow .ID = INT$
$E \rightarrow .\{L\}$
ID
s_1: $E \rightarrow ID. = INT$

s_2: $E \rightarrow ID = .INT$

LR(0) Parser

From s_2, if we recognized INT, then the next state will contain:

- $E \rightarrow ID = INT.$

Which is a reduce state.

$S \rightarrow E\$$
$E \rightarrow ID = INT$
$E \rightarrow \{L\}$
$L \rightarrow E$
$L \rightarrow L; E$

ID
ID
s_1: $E \to ID. = INT$

s_3: $E \to ID = INT.$

LR(0) Parser

From s_0, if we recognized $\{$, then the next state will contain:

- $E \to \{.L\}$

So the next state (the ϵ-closure) contains:

$S \to E\$$
$E \to ID = INT$
$E \to \{L\}$
$L \to E$
$L \to L; E$

LR(0) Parser

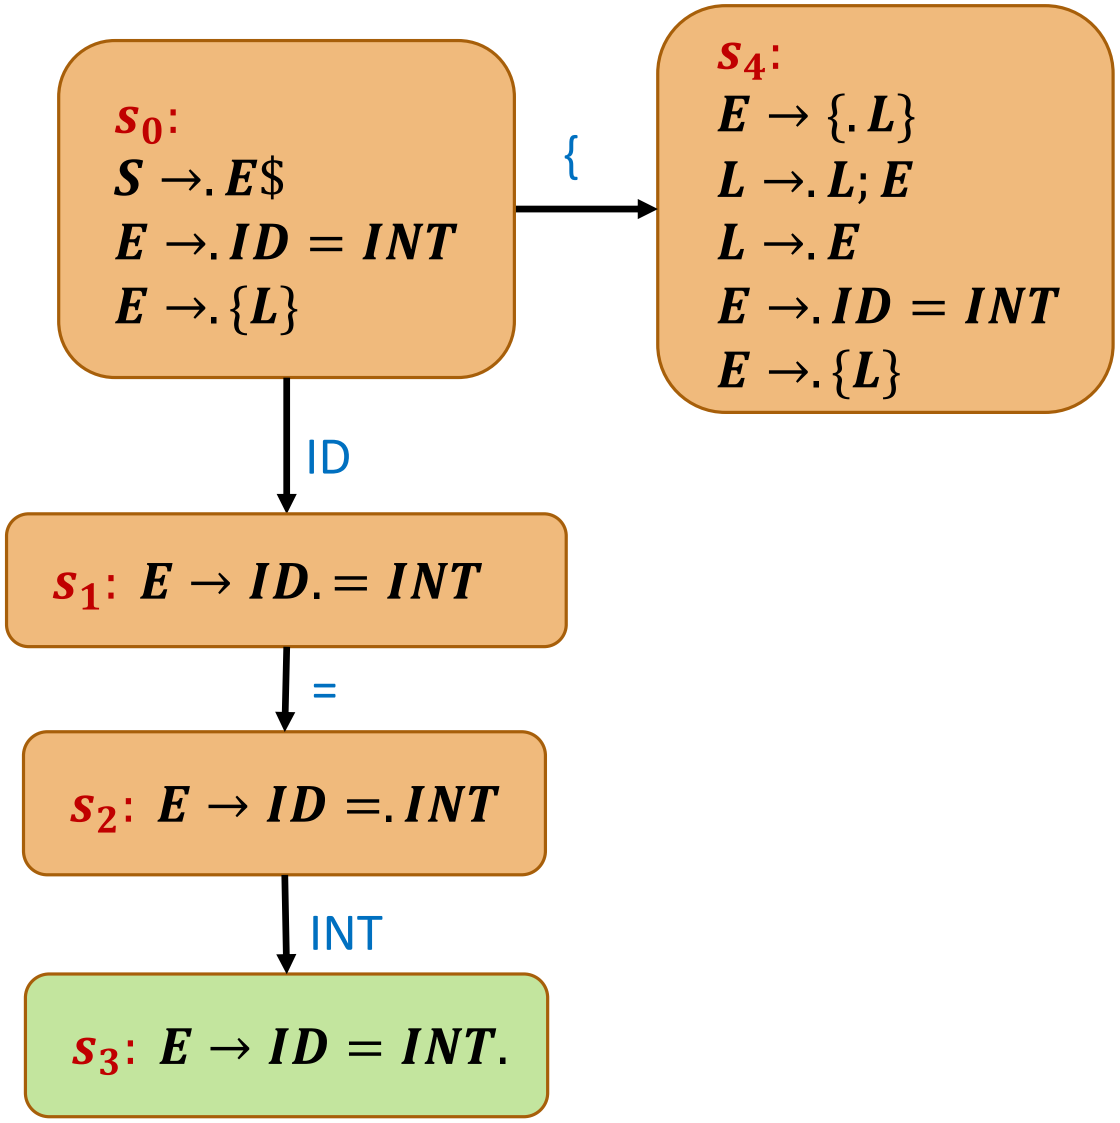
From s_0, if we recognized {, then the next state will contain:

- $E \rightarrow \{.L\}$

So the next state (the ϵ-closure) contains:

- $E \rightarrow \{.L\}$
- $L \rightarrow .L; E$
- $L \rightarrow .E$
- $E \rightarrow .ID = INT$
- $E \rightarrow .\{L\}$

$S \rightarrow E\$$
$E \rightarrow ID = INT$
$E \rightarrow \{L\}$
$L \rightarrow E$
$L \rightarrow L; E$



s_0:
$S \to .E\$$
$E \to .ID = INT$
$E \to .\{L\}$

LR(0) Parser

From s_4, if we recognized $\{$, then the next state will contain:

So the next state (the ϵ-closure) contains:

$S \rightarrow E\$$
$E \rightarrow ID = INT$
$E \rightarrow \{L\}$
$L \rightarrow E$
$L \rightarrow L; E$

LR(0) Parser

From s_4, if we recognized {, then the next state will contain:

- $L \rightarrow .L;E$
- $L \rightarrow .E$
- $E \rightarrow .ID = INT$
- $E \rightarrow .\{L\}$

which was already computed: s_4

$S \rightarrow E\$$

Parsing with CUP

CUP

- Given a user-specified grammar, generates an LALR parser
- Works with JFlex, which provides the parsed tokens
- Other tools:
  - Bison (for C)

CUP Spec: AST Nodes

- We need to **decide** which node types we have in our AST
- We need to **define** the classes for these AST nodes

CUP Example

Consider the following CFG:

- $E \rightarrow INT$
- $E \rightarrow V$
- $E \rightarrow E + E$
- $E \rightarrow E \ - E$
- $V \rightarrow ID$
- $V \rightarrow V\,.\,ID$

CUP Example: Terminals

terminal Integer INT;
terminal String ID;
terminal PLUS;
terminal MINUS;
terminal DOT;

CUP Example: Non-Terminals

non terminal AST_EXP EXP;
non terminal AST_VAR VAR;

CUP Example: Operator Precedence

precedence left PLUS;
precedence left MINUS;

CUP Example: Grammar

```
start with EXP;
EXP ::=

    VAR:v {: RESULT = new AST_EXP_VAR(v); :} |

VAR ::=
    ID:name {: RESULT = new AST_VAR_SIMPLE(name); :} |
    VAR:v DOT ID:fieldName {: RESULT = new AST_VAR_FIELD(v, fieldName); :};
```

CUP Example: AST Nodes

For the non-terminal ***VAR***:

```
public abstract class AST_VAR extends AST_Node {

```

CUP Example: AST Nodes

For the rule ***VAR ::= ID:name***:

```
public class AST_VAR_SIMPLE extends AST_VAR {
	public String name;
	public AST_VAR_SIMPLE(String name) {
		this.name = name;
	}
}
```

CUP Example: AST Nodes

For the rule ***VAR ::= VAR:v DOT ID:fieldName*** :

```
public class AST_VAR_FIELD extends AST_VAR {
	public AST_VAR var;
	public String fieldName;
	public AST_VAR_FIELD(AST_VAR var, String fieldName) {
		this.var = var;
		this.fieldName = fieldName;
	}
}
```

CUP Example: AST Nodes

For the non-terminal ***EXP***:

```
public abstract class AST_EXP extends AST_Node {

```

CUP Example: AST Nodes

For the rule ***EXP ::= INT:i***:

```
public class AST_EXP_INT extends AST_EXP {
	public int value;
	public AST_EXP_INT(int value)	{
		this.value = value;

- $S \rightarrow X$
- $S \rightarrow cb$
- $X \rightarrow aXb$

LR(1)

Maintain items with **more precise** look-ahead sets

An **LR(1) item** is of the form:

- $N \rightarrow \alpha . \beta \ \{\sigma\}$
- where $\sigma = t_1, t_2, \ldots$ (terminals)

LR(1) Item Closure Set

The **LR(1) closure set** of an LR(1) item i is a set S such that:

- $i \in S$
- If $A \rightarrow \alpha . N\beta \; \{\sigma\} \in S$ then for each rule $N \rightarrow \gamma$:
  - $N \rightarrow . \gamma\{\tau\} \in S$, where $\tau = First(\beta, \{\sigma\})$

Definition for $First(\beta, \{\sigma\})$:

- If β is not nullable:
  - $First(\beta)$
- Otherwise:
  - $(First(\beta) \cup \{\sigma\}) \setminus \{\epsilon\}$

Resolving Conflicts

When having a shift/reduce conflict:

- $E_1 \rightarrow \alpha_1 t_1 \beta_1 .$
- $E_2 \rightarrow \alpha_2 . t_2 \beta_2$

If t_1 has higher precedence, **reduce**

If t_2 has higher precedence, **shift**

Resolving Conflicts

In our case:

- $E \rightarrow E + E.$
- $E \rightarrow E. * E$

Assuming that multiplication has higher precedence:

- Resolve by Shift
